

**2. Problem statement:** Use the Wysa chatbot/app, find out 3 AI-related issues, and provide screenshots. Think about possible solutions to these and briefly document your thought processes. You can provide links to existing approaches and papers wherever necessary.

I have used and spent quite a time with Wysa chatbot. Firstly, its working brilliantly and most of the responses are correlated and precise. I really appreciate that and the algorithms used and training of the AI bot is also excellent. But in the purpose of finding the AI-related issues, I had to become a detective and scrutinize things

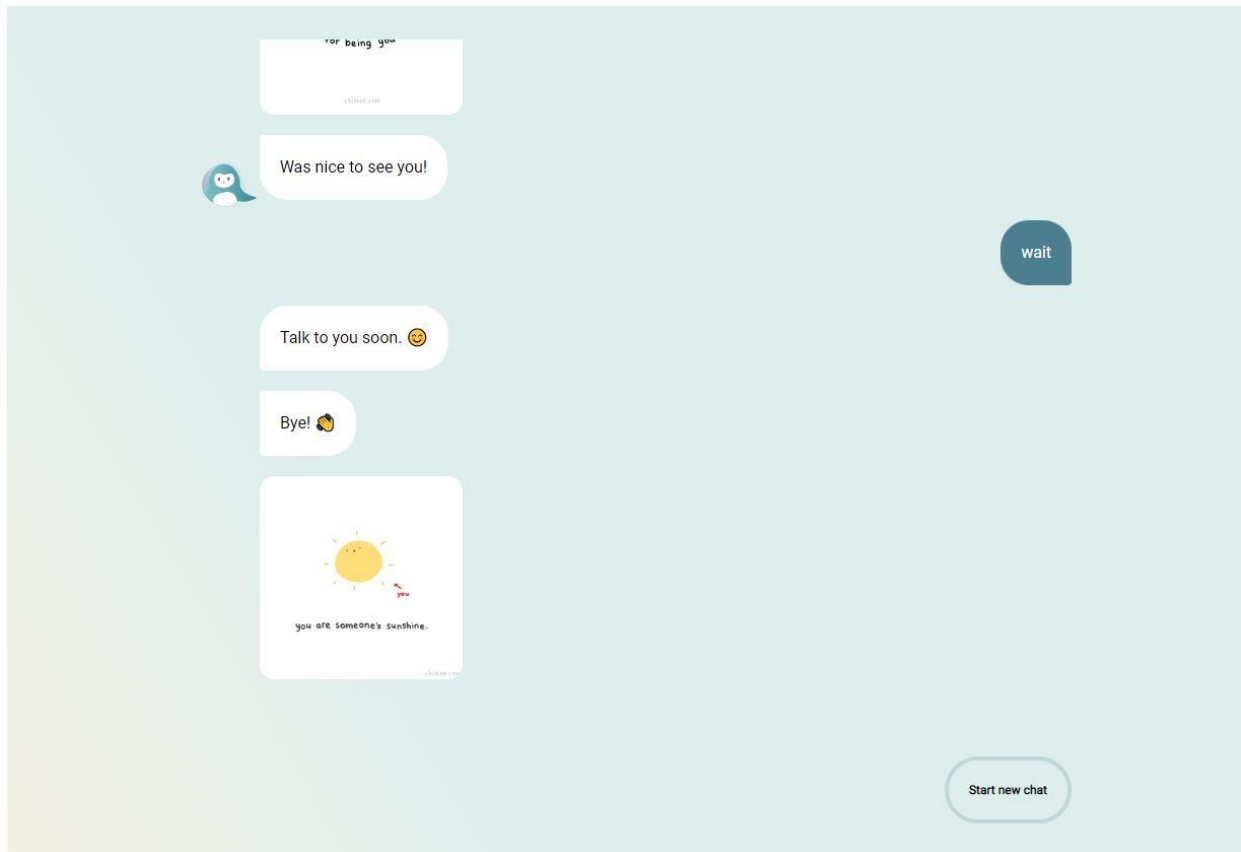

Here are my 3 issues I've found, which has scope of improvement

The answers given by model are not very situation related and doesn't feel like you're talking to a fellow individual. That can be achieved by observing the keywords used by others and gaining sentiment from them.

I felt sensing the punctuation mark (question mark here), it would've been great even if it spoke a single line about the topic questioned, or mention anything about related information to the question. That as well can be done by more efficient training of the model and processing the texts better.

I personally felt It would've been great If there was humor or funny jokes during the conversation. Let's say you're talking about sports, a funny joke or a funny fact would help a lot in uplifting the mood of the conversation and make it more engaging instead of a boring conversation.

It would be great to add a feature where on observing a particular topic and set of keywords, the bot can generate a joke on its own or find some fun facts online about it. It will improve the conversation hugely
